Pathogen tests are completed and results entered. WebMerge uses color coded formatting to display results along with additional specimen evaluation data

**Tick Test ID** 25233

### Tick ID Information

**Specimen ID:** 263441797

**Tick specimen is consistent with:** Nymph

**Tick Species:** Deer tick (*Ixodes dammini* = *I. scapularis*)

**Estimated duration of attachment:** > 2 days

**Date results sent to customer:** 07 Jul 2016 12:00 AM

**Date/Time Processed:** 06 Jul 2016 12:00 AM

**Evaluation Completed by:** RJP

**Specimen Evaluation Results:** Welcome to IdentifyUS and thank you for submitting images for evaluation. The tick you imaged is consistent with a nymphal deer tick. Based upon the extent of engorgement, it was attached and feeding for more than two days. Hence, if infected, it would have had opportunity to transmit any of several kinds of pathogens. We suggest you share this information with your clinician and discuss prophylactic treatment. You are welcome to submit this tick for assay of an array of pathogens. Follow the link for more information.

Form and results are provided in a professional manner suitable for presentation to physician for further discussion.
